

Vitale Fly Ash Consolidation and Habitat Restoration

Beverly, MA

Soil contamination from fly ash that was dumped years ago covered several acres in a watershed leading down to Wenham Lake. The Vitale Fly Ash Consolidation and Habitat Restoration project involved excavating all contaminated soil, placing it in an upland area, and capping it. Also included was the restoration of wetlands as well as building sports fields on the capped area. T. Ford Company was the general contractor.

Agresource supplied wetland soil that had to undergo extensive testing for contaminants and meet strict specification requirements. Agresource used its own compost made in nearby Ipswich as well as a special mineral filler selected from Aggregate Industries in Swampscott. Using these two materials ensured a clean, consistent, and high-quality wetland soil.
